PREFACE

One thing that soon becomes apparent to anyone who works in a natural history library is the wealth of illustrations which have been used in conjunction with scientific publications. Eighteenth- and nineteenth-century art and science are so closely related in the zoological fields that it becomes difficult to separate the two; one could no more imagine the great zoological journals without their plates than a zoo without the animals.

Important zoological illustrations are part of the history of the science, but it is still difficult to gain access to them through standard bibliographies. Books and articles on the history of natural history art provide scattered information, but a great deal of bibliographical work remains to be done. It was for this reason that we undertook to index the artists who created the plates in the publications of the Zoological Society of London. Our previous work, on the **Proceedings**, along with the current volume, should provide some aid to researchers who wish to examine the plates in the publications of the Society published before the advent of totally photographic processes. We hope that others will continue the work we have begun and create similar indexes for the many journals which remain. The fields of natural history, librarianship and printing history will all benefit from such work.

It would be pleasant to state that, having compiled one such index, this one was easier to bring together. It would be pleasant, but not entirely true. Each publication, with its own particular assortment of plates, presents its own problems. Working through these problems and finding what we hope are the most appropriate solutions is the most satisfying aspect of compiling this **Index** (apart, of course, from actually finishing it). These challenges and the pleasure of working with the outstanding illustrations in the **Transactions** have made the process of compiling this work a satisfying experience for us.

ACKNOWLEDGEMENTS

We wish to thank Garland Publishing and Gary Kuris for their support. The plates in this work were photographed from originals in the collection of the Department of Library Services in the American Museum of Natural History by Olivia Bauer and Jackie Beckett of the Photography Studio in the Museum. Phyllis Johnson and Andy Bates are also thanked for putting up, for a second time, with the turmoil that accompanied the compilation of this work.

HOW TO USE THIS INDEX

Each plate published in the **Transactions** of the **Zoological Society of London** from volume 1 (1835) through volume 21 (1916-1936) has been bibliographically described in this work. Photographic process plates, maps, and diagrams have not been included. Arranged by artist, the citations are listed chronologically within each artist's section.

A subject index of common and scientific names as cited for the thousands of species depicted in these plates is provided at the end of this work.

The Citations

Each citation is composed of the following elements: date and plate number, title of plate (if given), the subject of the plate, a description of and notes on the plate and a citation for the article which the plate illustrates.

For titled plates (other than those simply listing the scientific name of the species depicted), this title has been given in the citation, in quotes, following the number of the plate.

The scientific names of the species depicted in the plate are listed, in **bold face**, as cited, and in the same order as that found in the description of the plate published with the article. The names may not conform with current usage.

The description and notes section of the citation indicates if the plate is an engraving, a lithograph (i.e., uncolored), a hand-colored lithograph, a chromolithograph or the product of another process. Even if the method of printing the plate is a photomechanical process, if the original work so reproduced was created by a person, it is included in this work. The name of the printer is also given.

For those plates where the artist's name is listed without qualification, or is simply followed by the note "del." (i.e., delineator), no note is given. Any other permutation of a proper name is noted as "plate signed..." followed by a transcription of the form on the plate. This note may include the names of co-artists and/or lithographers. Cross-references have been provided when more than one artist created a plate, with the artist whose name is listed first having precedence. Cross-references are not provided for lithographers.

The note "signed" concerns those plates in which the illustration itself bears the signature or monogram of the artist. This note should not be confused with "plate signed" which concerns the names presented on the margin of the plate.

Finally, the accompanying article is cited including author, title, year and pagination of the article (or articles) for which the plate was created.

The Subject Indexes

The scientific names listed in the citations for the plates have been divided into several major taxonomic groups: amphibians and reptiles; birds; fish; fossils (which are also listed in the other sections of the subject index); insects (including separate sub-groups of beetles and butterflies and moths); invertebrates (with a sub-section for shells); and mammals.

At the beginning of most of these subject index sections, some common names are also listed. These common names are only the most obvious, either from the title of the plate or the title or text of the article. These sections of the subject indexes are not comprehensive and should be used only as a quick finding aid. For those users who wish only to find the citations for plates depicting a monkey, pheasant or salmon, this should usually be sufficient.

The scientific names provide the most useful and accurate method of finding plates of a particular species. For those users who are unfamiliar with taxonomic name forms, there are many reference works which will provide cross-indexing from common names. A very comprehensive work of this type is Synopsis and classification of living organisms, edited by Sybil P. Parker (New York: McGraw-Hill, 1982). It should be remembered, however, that some of the names listed in the subject index may no longer be currently used by zoological taxonomists. Synonomies for some zoological

taxa are available, and the incidence of type specimens illustrated in the Proceedings greatly increases the user's chances of finding a reference to the original name as given in this **Index**.

The citations for the plates in the subject index refer to the artist, volume and plate. Unless more than one artist with the same surname created plates for the **Transactions**, only the surname is used. When there is more than one artist with the same surname (e.g., Joseph, Peter and Pierre Jacques Smit), their initials are used to distinguish among them. At times, when the name was particularly long, the periods after the initials were dropped to allow the citation to be placed within the column. Whenever possible, however, this was avoided. A similar system was used in the **Index** to the **Proceedings**.

Finally, mention should be made of the fact that the "Shells" section of the subject index only includes those species for which the shell was illustrated in a plate. Those species for which the animal was depicted are listed in the "Invertebrates" section.
